**Short Cruise Report**  
**RV Maria S. Merian Cruise MSM71**

**Las Palmas de Gran Canaria - Heraklion**  
**07. February 2018 – 27. February 2018**

**Chief Scientist: Heidrun Kopp**  
**Captain: Ralf Schmidt**

## Objectives

The aim of cruise MSM-71 LOBSTER (**L**igurian **O**cean **B**ottom **S**eismology and **T**ectonics **R**esearch) is twofold: 1) to conduct a detailed amphibious seismic refraction survey of the Ligurian basin transition from the oceanic to the continental domain, and 2) to recover a network of French/German ocean bottom seismometers (OBS) in the framework of AlpArray and the German SPP 2017 'Mountain Building Processes in 4D' (<http://www.spp-mountainbuilding.de/>) (Fig. 1). Alp Array is a European initiative with the aim to deploy several hundred closely spaced broadband seismometers that cover the entire Alpine orogen to provide state-of-the-art imaging of subsurface structures. The offshore component of AlpArray involves the deployment of 29 broadband stations from France/Germany in the Ligurian Sea. This deployment took place in June 2017 using the French RV PourquoiPas? as platform. In order to share ship-related costs between the two nations, recovery was conducted using RV Maria S. Merian during cruise MSM71. OBS recordings of teleseismic events are essential to define subsurface structures at the transition from the Western Alps to the Apennines and improve our understanding of the 3D-geometry of the system and its kinematics. In addition, the two active wide-angle transects of 270 km (147 nm) and 136 km (73 nm) aim to unravel the upper structure of the Ligurian Basin at crustal scale resolution.

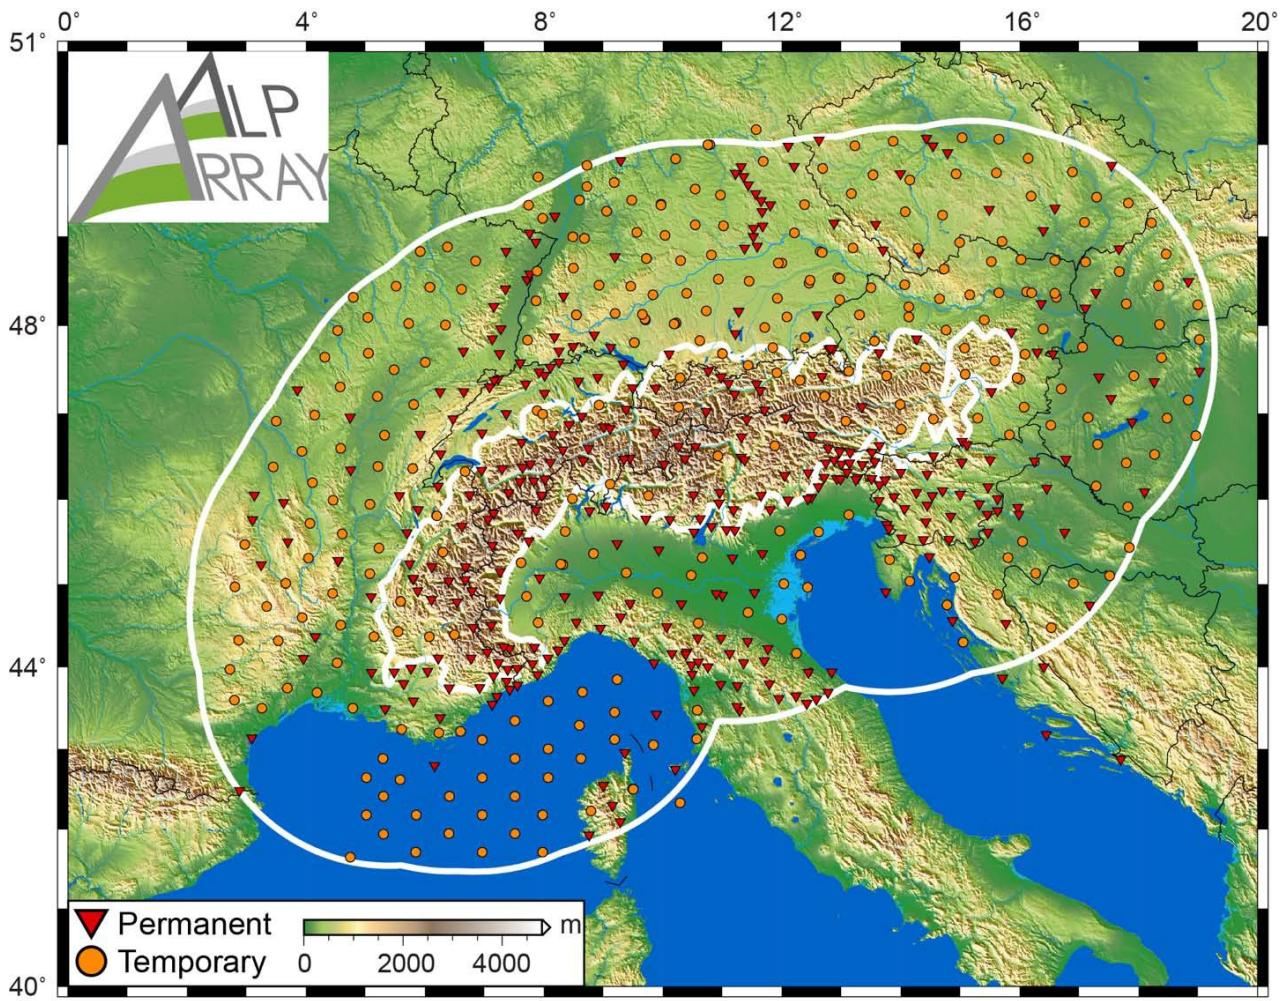

Figure 1: Map of the station distribution achieved in the framework of AlpArray (as of February 2018).

## Narrative

Cruise MSM 71 commenced in Las Palmas de Gran Canaria, Spain, on Feb 7, 2018, where 21 scientists from France, Germany, the Netherlands and China embarked on RV Maria s Merian. The vessel left port at 16:30h local time with some hours delay after a last provisions container was loaded to start on the transit north towards the Strait of Gibraltar. The previous days in port as well as the transit were used to prepare our equipment, in particular to set up the air guns, the streamer and the short period ocean bottom hydrophones and ocean bottom seismometers. After five days of transit we arrived at the first OBS site on Feb 12, 2018 at 09:00h to release the first station of the broadband OBS AlpArray network (OBS A412A), which is positioned at the southwestern extremity of the working area at 41°38,85'N/04°44,69'E (Fig. 4.1). The instrument had been continuously recording since June 2017. We continued on a short transit north to the NW starting point of the 147 nm long refraction line P01 at 42°33,00'N/05°30,00'E. During this time, weather conditions deteriorated and we could only deploy two short-period stations before wind conditions of up to 11 Bft forced us to wait for calmer conditions. An XSV probe was launched at 42°32,44'N/05°35,33'E, reaching a depth of 1956 m. We re-commenced OBS deployment after a two hour break, when conditions had calmed to around 8 Bft. The deployment of a total of 35 short period stations at 4 nm spacing was completed at 13:45h on Feb 13 at 42°12,00'N/08°30,00'E. Simultaneously, colleagues from IDPA-CNR of Milan installed three land seismometers on the western portion of the island of Corsica to record our air gun shots. Marine mammal mitigation procedures were initiated prior to shooting. Shooting of

profile P01 commenced at 15:15h with two G-gun arrays of 84 l total towed on the starboard and portside of RV Maria s Merian. A 280 m long geo-eel streamer was deployed along the profile and recovered after we passed the last seafloor station. The vessel then turned on to a 45 nm long southward profile to shoot into the AlpArray broadband seismometer network. The turn was used for maintenance of both air gun arrays. Shooting was terminated on Feb 15 at 09:00h at 41°54,16'N/05°29,24'E.

This was followed by the recovery of five broadband OBS from the AlpArray network located in the southwestern part of the study area (A421A, A414A, A413A, A404A, A405A; all recovered between 10:45h and 22:20h on Feb 15, 2018). Recovery was continued the next day (A401A, A402A, A406A, A415, A423A, A430, A424A). During recovery, it was noticed that the radio beacon and flash light as well as the flag on the DEPAS and GEOMAR stations did not protrude from the water as the instrument ascended horizontally and due to insufficient weight did not turn into the vertical. Consequently, the radio beacon and flash light could not function and did not send any signals. We thus had to rely on a visual location of the instruments, at night aided by the ice flood lights of RV Maria s Merian. As the weather conditions were optimal and the sea very still during recovery, we could also locate the instruments on the ship's ice radar. Despite our efforts, one station could not be recovered (A406A) as it could not be located on the surface.

French military operations made it necessary to schedule the recovery of stations A416A, A408A, A409A and A417A for Feb 17, as the maritime area where these stations are installed was to be closed to ship traffic afterwards. We thus continued recovery operations in this area. However, station A408A did not respond to the release or range signal and could not be recovered. We next headed towards OBS A418A, which was safely recovered before heading south to start recovery along the refraction profile at 21:30h, Feb 17. Due to scheduling issues we recovered stations along the western part of the profile first, starting with OBS 113 towards OBH 135. OBH 134 responded to our release signal, but due to technical failure could not turn the hook to release the anchor. Recovery along profile P01 was terminated at 17:00h on Feb 18, before we had to leave the area by Feb 19, 07:00h due to military operations. As we could also not access the broadband stations located to the south of profile P01 due to closure of the maritime region, we subsequently headed north and on Feb 19 at 05:00h arrived at station OBS A419A, which was safely recovered.

Subsequent stations A411A, A434A and A420A were all located in Italian waters and safely recovered before we headed for station A427A, which was situated in French territory. All stations were safely recovered during daylight hours of Feb 19, 2018. We then continued to deploy a total of 15 sea floor stations (12 OBS and 3 OBH) along the second refraction profile P02, which starts at 43°05.07'N / 08°11.82'E and trends in a NE-SW direction covering the central part of the Ligurian Basin to the crossing point with profile P01 at 42°21.00'N / 07°15.00'E. Mammal and turtle mitigation procedures proceeded the deployment of the air gun arrays and the streamer, before shooting commenced at 07:30h on Feb 20, 2018 and lasted until 01:45h on Feb 21, 2018. Prior to recovery of the stations on profile P02 we collected station A425A and A426A located east of profile P02 during the morning of Feb 21, 2018. A second XSV probe was launched at 42°52.80'N/08°37,29'E. Instrument recovery on P02 was finished at 01:15h on Feb 22, 2018 and we continued with the recovery of the remaining stations on the eastern portion of P01 (OBS112-OBS101), which was achieved by 12h on Feb 22, 2018. The final four stations of the AlpArray network (A429A, A422A, A428A, A313A) were recovered on Feb 22 starting at 16:000h until Feb 23 at 07:15h.

On Feb 23, 2018 at 14:30h RV Maria s Merian commenced the passage through the Strait of Bonifacio to begin our transit towards the port of Heraklion/Crete. During transit, we passed the Strait of Messina on Feb. 24, 2018 and stopped at a seafloor geodesy array (GeoSEA) offshore Catania, Sicily, located at 37°32,39'N/15°15,53'E to test the newly installed SONARDYNE Ranger system on RV Maria s Merian, as the GeoSEA array uses SONARDYNE acoustic transponders for telemetry measurements on the flank of Mt Etna.

During the short stop of RV Maria s Merian we could verify that all stations are up and running, before we commenced our final transit to Heraklion at 05:00h on Feb. 25, 2018.

RV Maria s Merian safely reached the pilot station at Heraklion harbor on Feb 27 at 08:00h and berthed at 08:30h, terminating cruise MSM 71 (Fig. 4.2). Weather conditions were very variable during the cruise, with stormy phases (11 Bft) and intermittent calm seas.

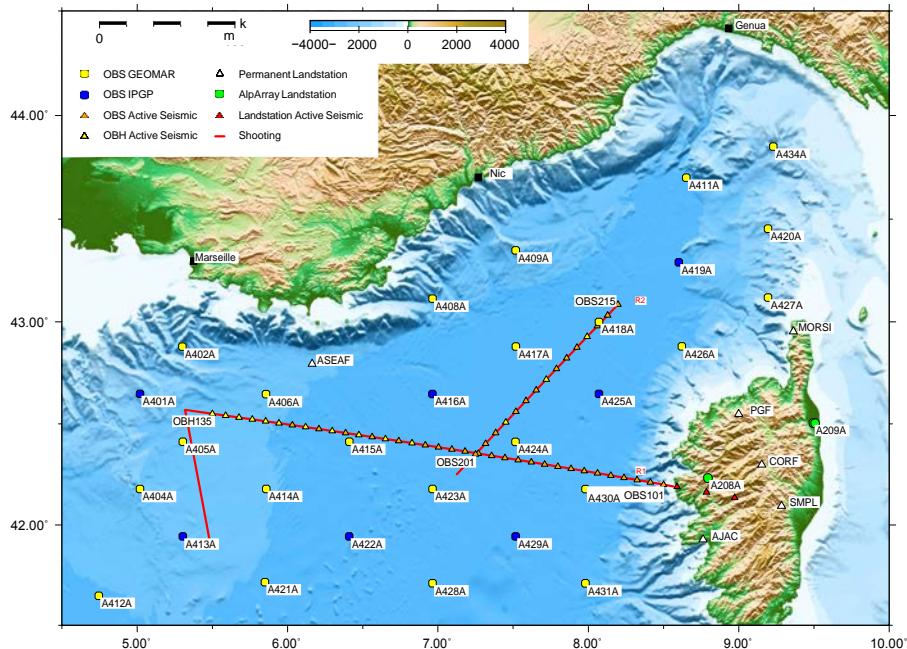

Figure 2: Station and profile distribution in the Ligurian Sea. Two refraction/reflection profiles were acquired with 35 and 15 stations, respectively. In addition, shooting along profile P01 was extended to the SE in order for the long-term AlpArray OBS to record the shots.

## Acknowledgements

We like to thank Captain Ralf Schmidt, his officers and the crew of R/V Maria S. Merian for their support of our measurement programme and for creating a very friendly atmosphere on board. Their professional assistance at sea is kindly acknowledged.

The ship time of R/V Maria S. Merian was provided by the Deutsche Forschungsgemeinschaft DFG. We gratefully acknowledge the support.
