Short Cruise Report
R/V METEOR M130
Mindelo, Cape Verde – Recife, Brasil
29th August – 3rd October 2016
Chief Scientist: Dr. Marcus Dengler
Captain: Jan F. Schubert

Figs. 1: Bathymetric map with cruise track of R/V METEOR cruise M130 (red solid line) including locations of CTD/LADCP stations, mooring recoveries and redeployments, multinet and photosynthetically active radiation (PAR) profile stations. Territorial waters of different countries are marked with thin black solid lines.

Objectives

A physical - biogeochemical survey was carried out in the north eastern tropical Atlantic and in the western tropical South Atlantic. The measurement program was an integral component of the DFG Collaborative Research Center (SFB) 754 and the BMBF-joint project “Regional Atlantic Circulation and Global Change” (RACE II). The main objective for the works in the oxygen minimum zone (OMZ) of the eastern tropical North Atlantic (ETNA) is to improve oxygen budget estimates. This includes determining oxygen supply by mean advection, diapycnal and lateral eddy fluxes, and quantifying oxygen consumption. Other objectives were investigating the role of zooplankton and its vertical migration for fluxes of particulate and dissolved matter to the OMZ and advancing quantitative understanding of nitrogen fixation in the tropical Atlantic. Main objectives of the measurements program in the region of the western tropical south Atlantic were to investigate the variability of transport and water mass properties of the western boundary circulation as part of the deep and shallow meridional overturning.

A major component of the work program was the recovery of 9 and the redeployment of 8 moorings collecting velocity, oxygen, temperature, and salinity time series. The measurement program included temperature-salinity-depth and oxygen profiles (CTD/O₂), lowered acoustic Doppler current profiles (LADCP), underwater vision profiles (UVP), shipboard velocity profiles, multinet casts, and photosynthetically active radiation profiles. Water samples were analyzed for numerous variables including salinity, oxygen concentrations, tracer concentrations (CFC-12, SF6), nutrients in micro and nano range, and halocarbons. Additionally, filtered samples were taken for NanoSIMS, flow cytometry, dissolved organic phosphorus, DNA/RNA, particulate organic matter, particulate organic nitrogen, and chlorophyll *a*. Samples of Heme content and dissolved iron were taken from a towed trace metal clean fish. Furthermore, incubations to quantify nitrogen fixation and primary productivity were performed.

Narrative

Due to a late arrival of one of our container carrying dangerous goods in Mindelo, São Vicente, Cape Verde, the departure of R/V METEOR was delayed by one day. Customs cleared the delayed container in the morning of August 29th and we were able to leave port at 11:00 local time (12:00 UTC). The working program started 6 hours later with a successful recovery of a mooring at the Cape Verde ocean observatory (CVOO) site 50 nautical miles (nm) northwest of São Vicente. During the night, a full-depth profile with the conductivity-temperature-depth-oxygen (CTD/O₂) rosette system was measured and plankton samples with a multinet were collected. The main CVOO mooring was successfully recovered in the early morning of August 30th. After additional CTD, multinet and microstructure stations and trace metal clean water sampling using a towed fish, R/V METEOR left the CVOO site for an emergency recovery of a drifting buoy about 150 nm to the northeast. The buoy was originally deployed off Cape Blanc just outside the EEZ of Mauritania and had broken loose a month before our cruise. It weight 2.3 tons and had a diameter of 3 meters and was equipped with a dust collector for investigating Saharan dust deposition and meteorological sensors. The rescue of the buoy, owned by the Royal Netherlands Institute of Sea Research (NIOZ), was coordinated jointly with the DFG Senatskommission für Ozeanographie, the Leitstelle Deutsche Forschungsschiffe and the National Marine Faculty at NIOZ. Prior to the recovery, it was agreed that NIOZ will refund the dedicated ship time within the OFEG barter ship-time frame work. Thanks to the professionalism of METEOR’s crew, the recovery of the buoy was completed within a few hours, minimizing the loss of ship time for our cruise. The vessel returned to the CVOO cite on Sep. 1st at 4:00 UTC to redeploy the CVOO mooring and to

collect additional water samples with the CTD rosette system and the towed fish. The CVOO related activities were completed 13h later at 17:00 UTC.

CTD/O₂ section work along 23°W started at 15°N on September 2nd, 10:00 UTC and ended at 5.5°S on September 19th, 10:30 UTC. CTD/O₂ profiles were collected to a depth of 1200m between 15°N and 5.5°N and to full ocean depth between 5°N and 5.5°S. In addition to the CTD/O₂ sensors and the attached underwater vision system, a chlorophyll sensor, turbidity sensor and an optical nitrate sensor was attached to the rosette frame. The latter could only be used during casts less than 2000 m deep. Additionally, an upward and a down-looking acoustic Doppler current profiler (LADCP) were attached to the rosette to measure full depth velocity profiles. Apart from CTD profiles, spectroradiometer profiles were collected every mid-day to infer the distribution of photosynthetically active radiation in the upper 100 m of the water column, multinet casts were performed to a depth of 1000m at several positions along the transect for the sampling of zooplankton and microstructure profiles of velocity shear and temperature were collected to infer mixing levels and to determine diapycnal oxygen and nutrient fluxes. Water sampling focussed on resolving the vertical spreading of an artificial tracer that was released in the center of the oxygen minimum zone at 11°N, 21°S in December 2012 and on the upper water column to obtain information about nitrogen fixation. Additionally, two shipboard ADCPs with a frequency of 38 kHz and 75 kHz were continuously sampling horizontal velocities in the upper 600 and 1000 m, respectively, and two thermosalinographs were measuring near-surface temperature and salinity. All systems worked well throughout the cruise. However, in the morning of September 11th contact to the tethered microstructure profiler was lost while the profiler was descending during a microstructure station (MSS) at 6°S, 23°W. When we attempted to recover the profiler using the winch, the microstructure cable broke and the profiler (serial number 32) was lost. The most likely explanation for the broken cable is that it was damaged by the bite of a fish. Microstructure measurements performed later during the cruise were done with a spare profiler (serial number 26) that had an identical sensor setup.

In the afternoon of September 5th, the 23°W transect was discontinued to conduct a survey focussing on determining the variability of the artificial tracer concentrations in the region between 8°N and 11.5°N, 19°W and 23°W. Water samples were taken at stations where tracer concentrations had been determined during the previous R/V METEOR cruises M97, M105 and M116. During the survey, a mooring at 11°N, 21°13'W was recovered and redeployed in the morning and evening of September 8th, respectively. This position approximately marks the centre of the oxygen minimum zone of the tropical Atlantic. The mooring was equipped with velocity, temperature, salinity and oxygen sensors. The tracer survey was completed in the morning of September 10th.

In the morning of September 11th, a mooring at 23°W, 5°N was recovered. The mooring's instrumentation was identical to those deployed at the 11°N mooring. Similar to the 11°N mooring, all sensors had worked well, but some of the oxygen loggers had stopped data recording early - a few weeks or months after mooring deployment in 2015. This error was due to a falsely adjusted operational mode of the recording units that caused elevated power consumption. R/V Meteor reached the equator just after midnight on September 15th. In the morning of that day, the equatorial mooring was successfully recovered and redeployed in the afternoon. Again, all sensors had worked well and we were particularly happy to have retrieved complete velocity, temperature, oxygen and salinity time series from a moored profiler that climbed the mooring wire between 1000m and 2500m depth.

After finalizing the 23°W section in the morning of September 19th, R/V METEOR headed southwest towards the western boundary off Brazil. During the two-day transit a crossing-the-line ceremony and the "Bergfest" provided a welcomed change. The work program along the

11°S section started at 11.5°S, 32°W in the evening of September 21st. During the 11°S section work, 4 moorings were recovered and redeployed and the data of two pressure inverted echo sounders were read-out using acoustic modems. All mooring operations went well and we were very happy about the returned data - 37 of the 38 instruments mounted to the moorings recorded full data sets. Additionally, 20 full-depth CTD/O₂ profiles were collected along the 11°S section. The last CTD/O₂ station along 11°S was completed shortly after midnight of September 27th. The final CTD/O₂ section along 5°S was started in the morning of September 28th and completed in the late afternoon of October 1st. A total of 19 full depth CTD/O₂ stations were collected at 5°S. R/V Meteor arrived as scheduled in Recife at 6:00 in the morning of October 3rd.

Acknowledgements

We are grateful to Capitan Schubert und his crew for the excellent collaboration and the pleasant working atmosphere during the cruise. The crew of FS METEOR greatly contributed to the success of the cruise. The ship time of METEOR was provided by the German Science Foundation (DFG) within the core program METEOR/MERIAN. Financial support was provided by the German Science Foundation (DFG) as part of the SFB754 (Climate Biogeochemistry Interactions in the Tropical Ocean) and by the German Federal Ministry of Education and Research (BMBF) as part of the cooperative project “Regional Atlantic Circulation and Global Change” (RACE II, 03F0729D).

M130 Participants

No.	Name	Function	Institution
1	Dengler, Marcus, Dr.	Chief scientist	GEOMAR
2	Al Balushi, Hajar	CTD/MSS watch, LADCP	GEOMAR
3	Bruto, Leonardo, Dr.	Moorings, CTD/MSS watch	UFPE
