**Short Cruise Report**  
**R/V METEOR M132 Walvis Bay – Cape Town**  
**15<sup>th</sup> November – 11<sup>th</sup> December 2016**  
**Chief Scientist: Kerstin Jochumsen**  
**Captain: Rainer Hammacher**

Cruise Track METEOR 132, Walvis Bay – Cape Town, Nov. 15 – Dec. 11 2016

## **Objectives**

Cruise R/V METEOR 132 aimed at collecting high resolution observations at the upwelling front off Namibia. The goal was to obtain a detailed understanding of the interaction between meso- and submesoscale processes occurring at the front. The cruise was fully in the focus of physical oceanography, targeting energy exchanges between scales, which contributes to the DFG project TRR 181 (*Energy transfers in Atmosphere and Ocean*) from which the cruise was funded. The major goals of the cruise were: (1) observing mixed layer eddies and instabilities at the upwelling front and assessing their horizontal and vertical structure; (2) evaluating the generation, lifetime and dissipation of submesoscale features found in the working region; (3) quantifying the lateral exchange or tracers and properties across the front.

The data collected to obtain the listed goals was obtained from a variety of instruments: The vessel's ADCP was used to derive the mesoscale current field and to compare the results to anomalies in sea surface height as seen in satellite products. In order to locate upwelling filaments, R/V METEOR's thermosalinograph measurements were monitored and combined with information from satellite sea surface temperature data. CTD (conductivity-temperature-depth-oxygen) profiles as well as horizontal current profiles were taken at 121 stations, giving high vertical resolution data within the fronts of filaments and at the upwelling region. Profiles were conducted to a maximum depth of 500 m, as the focus of the cruise was on upper ocean processes. Beyond classical CTD measurements, CTD profiles were also obtained during transits from the moving ship, either with the help of a towed and undulating CTD system (ScanFish) or with an underway CTD system. In addition, microstructure profiling (MSS) was carried out on 63 stations (800 profiles), mostly close to CTD stations at pronounced temperature fronts. To investigate the uppermost region of the water column without contamination from the wake of the ship, current and temperature measurements were conducted from a research catamaran towed 100-150 m behind the ship on selected transects. The measurement program was completed by two autonomous gliders, which passed the temperature fronts several times, thereby obtaining hydrographic and dissipation profiles.

## **Narrative**

On 15<sup>th</sup> November 2016 at 08:00 UTC R/V METEOR departed from Walvis Bay port, heading westward on the Namibian shelf. Underway measurements using the ADCP and thermosalinograph systems installed on R/V METEOR were started at 8:40 UTC. The first station at 22°55.75' S, 13°05.1' E was dedicated to a glider recovery, which was deployed during cruise M131. The operation went smoothly and the glider was on deck at 13:30 UTC. The first CTD and MSS station was carried out at 23° S, 14°02.9' E at 16:15 UTC, which is the position of a long-term mooring operated by IOW. All systems were tested, but no water samples were taken. A first CTD section was conducted during 16<sup>th</sup> November. Then, R/V METEOR headed towards

25°14.8' S, 10°54.9' E, where a deep sea mooring had been deployed during cruise M99 in August 2013. A first recovery attempt in February 2014 during cruise M104 had failed. This time (on 17<sup>th</sup> November) the mooring again did not respond to acoustic commands and a dredging attempt was unsuccessful. The mooring is therefore considered to be lost.

R/V METEOR continued the cruise southwestward. Along the 130 nm of transit towards an upwelling filament identified in a satellite sea surface temperature (SST) image, underway measurements were complemented by measurements with a Scanfish, which provided hydrographic profiles of the upper 110 m of the ocean. Upon recovery on 20<sup>th</sup> November the Scanfish data cable was found to be damaged. The instrument was therefore not used during the rest of the cruise. One CTD station was carried out for calibration purpose at the location of the Scanfish recovery. The following days (20<sup>th</sup> to 22<sup>nd</sup> November) were dedicated to detailed measurements within the upwelling filament. 37 CTD stations and 21 MSS stations were performed, crossing the filament in north-south direction several times. At the southern boundary of the filament 12 surface drifters (SVP) were deployed in groups of three instruments, arranged in a triangle of 100 m and 200 m side lengths. They will report their position and ocean surface temperature in 30 min intervals during the next several months. In addition, one glider was deployed on 22<sup>nd</sup> November 8:10 UTC at 26°36.1' S, 12°3.3' E.

Late on 22<sup>nd</sup> November (23:30 UTC) an underway-CTD section was started towards east, where the upwelling front was located. The section was interrupted after only 3 profiles due to a malfunction of the winch. Repair was finished at 4:30 UTC on 23<sup>rd</sup> November and the measurements continued until 11:10 UTC. Three hours later a glider was deployed at 25°50.4' S, 13°18.7' E after two test dives for optimizing the ballast within the device. In the following the research catamaran was deployed and towed behind R/V METEOR with a speed of approx. 2kn. Simultaneously MSS profiles were conducted. The track was crossing the front back and forth during the night until the catamaran was recovered on 24<sup>th</sup> November 9:10 UTC. The rest of the day was spent with a CTD section in very high horizontal resolution (distance between stations 0.55 nm, 15 stations). Due to strong winds and waves only underway measurements were performed on 25<sup>th</sup> November, where the temperature distribution further offshore was investigated.

During the morning of 26<sup>th</sup> November another 12 drifters were deployed at the northern boundary of the filament. In the following, a track across the temperature front was sampled repeatedly with CTD and MSS stations, and later on using the catamaran. Profiling was stopped at 00:40 UTC on 27<sup>th</sup> November when R/V METEOR headed to the northeast to recover one glider at 25°50.2' S, 13°10.8' E. The device was on board at 04:10 UTC. The calm weather conditions were used to recover the second glider as well. After a transit of 9 hrs the glider position at 26°32.4' S, 11°41.1' E was reached, and it was recovered at 13:50 UTC. Station work

with CTD/MSS was continued on 27<sup>th</sup> and 28<sup>th</sup> November across the western extension of the filament, a location where the drifters had passed a few days before.

Due to severe weather conditions station work was stopped on 28<sup>th</sup> November 18:15 UTC and a large scale survey of the mesoscale eddy field was started. Using the ADCP mounted in the hull of the ship, R/V METEOR mapped the currents around the filament for about 2 days. On 30<sup>th</sup> November a new CTD/MSS section was started at 21:10 UTC at the filament in meridional direction, close to the location of the first drifter deployments. The section was completed on 2<sup>nd</sup> December, when another 6 drifters were deployed. The transit to the eastern edge of the filament was complemented with underway-CTD measurements. Due to the loss of one probe data acquisition only resumed to 18 UTC. At 22:00 UTC a new CTD/MSS section was started, crossing the northern boundary of the filament. One station was used as a calibration station for the MSS. Along the section the last 7 drifters were deployed on 3<sup>rd</sup> December from 10:20 UTC to 11:20 UTC.

The voyage continued with a transit to the upwelling front, where satellite images indicated the formation of a new filament. At 17:30 UTC on 3<sup>rd</sup> December the catamaran was deployed and towed across the front during the night. The device was recovered at 7:00 UTC on 4<sup>th</sup> December. The following CTD/MSS section had to be canceled after the first station due to strong winds and waves, only MSS measurements continued until the evening (18:15 UTC). The following 19 hours were again used for a detailed survey of the currents and temperature distribution in the region, using R/V METEOR's underway systems. Station work was resumed on 5<sup>th</sup> December 13:30 UTC at the upwelling front off Lüderitz. After the section had been completed on 6<sup>th</sup> December the catamaran was deployed at 15:10 UTC at the front and towed across the location of strongest temperature gradient. Meanwhile, MSS profiles were taken. The final CTD/MSS section of cruise M132 was conducted on 7<sup>th</sup> December at the same locations of the previous section to cover temporal variability of the upwelling front. At 5:00 UCT on 8<sup>th</sup> December station work was finished and R/V METEOR headed towards Cape Town. Underway measurements were stopped on 8<sup>th</sup> December 20:15 UTC, when the vessel reached the EEZ of South Africa. Finally, R/V METEOR arrived at the port of Cape Town on 11<sup>th</sup> December 7:45 UTC.

## Acknowledgements

We thank the crew, officers and Captain of R/V METEOR who created a great working atmosphere and without whom the data would not have been collected. The ship time of METEOR was provided by the German Research Foundation (DFG) through the "*DFG Senatskommission für Ozeanographie*". Scientific work on board was a contribution to the projects L3 (*Diagnosing and parameterizing the effects of eddies*) and T2 (*Energy budget of the ocean surface mixed layer*) of the Collaborative Research Centre TRR 181 "*Energy Transfer in Atmosphere and Ocean*" funded by the German Research Foundation.

## Participants

1.	Jochumsen, Dr. Kerstin	Chief scientist	IfM HH
