Short Cruise Report

RV METEOR

Las Palmas de Gran Canaria — Fortaleza

23.10.2024 — 28.11.2024

Chief Scientist: Dr. Torben Riehl

Captain: Rainer Hammacher

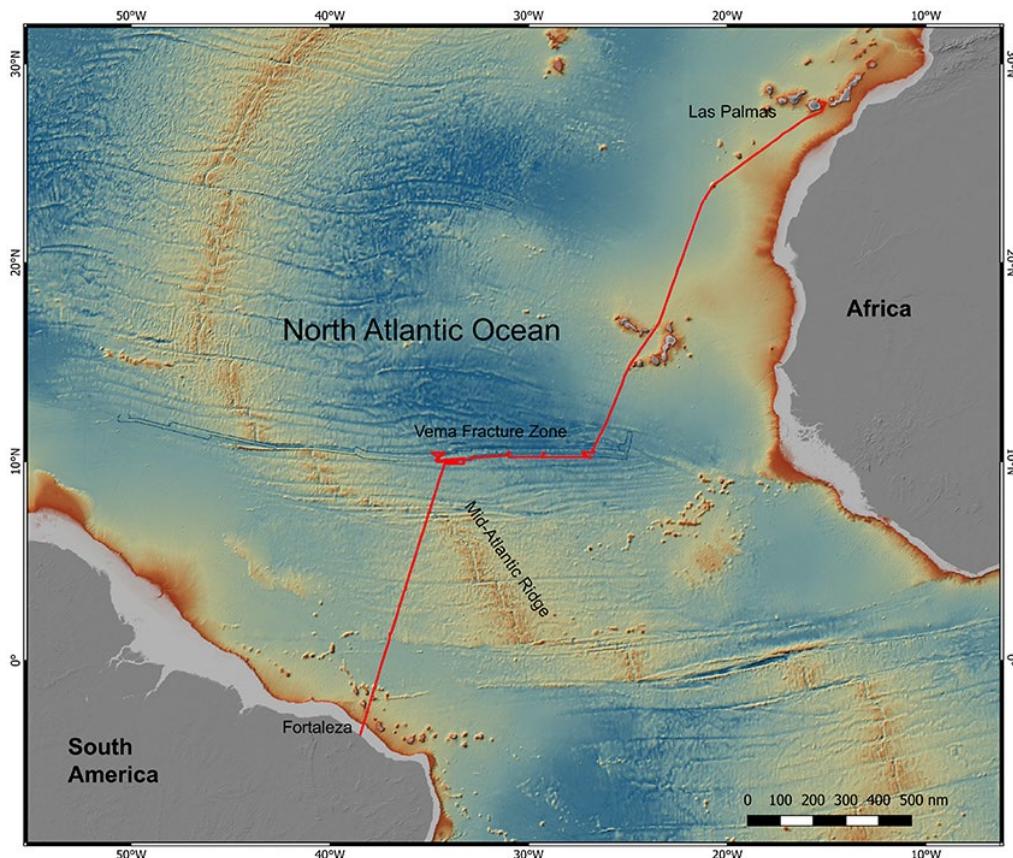

Figure 1: Cruise track of RV METEOR cruise M205. Map: Dr Torben Riehl, SENCKENBERG, chief scientist M205.

Objectives

The expedition M205 aboard RV METEOR (project “RUBBLE” — Rocky seafloor – Underestimated driver for Benthic Biodiversity Living in the abyss and its Evolution) investigated the relationship between habitat heterogeneity and abyssal benthic biodiversity through quantitative and qualitative seafloor sampling in the eastern Vema Fracture Zone (Figure 1). Grounded in prior taxonomic and bathymetric studies (e.g., Vema-TRANSIT), the research focused on the effects of topography and rocky seafloor structures on adjacent sediment variability and biodiversity.

Predicted hard substrates (e.g., rocky reefs and nodule fields) and echosounder-based habitat characterizations were ground-truthed. Megafaunal distribution and diversity, along with their traces (Lebensspuren), were mapped to study links between habitat characteristics and faunal diversity, distribution, and composition. Sediments and their fauna were also analysed in relation to habitat heterogeneity.

The project aimed to elucidate how habitat heterogeneity influences abyssal benthic biodiversity, particularly in sedimentary environments, contributing to large-scale biodiversity assessments and ocean governance. By identifying habitat preferences and linking them to hydroacoustic habitat mapping, the project supported marine protected area (MPA) designations, impact assessments for deep-sea mining, and the identification of Ecologically or Biologically Significant Areas (EBSAs) and IUCN Red List evaluations.

RUBBLE proposed five mechanisms through which rocky seafloor and topography influence biodiversity:

1. Providing habitats (e.g., attachment sites, caves, and crevices).
2. Offering a range of current exposures that transport food and larvae.
3. Modulating currents, creating turbulence, and driving sediment sorting and food gradients.
4. Fragmenting sediment biotopes, reducing connectivity among isolated habitats, but increasing connectivity for hard-bottom sessiles.
5. Inducing sediment dynamics, increasing habitat diversity through variable accumulation and redistribution.

Hypotheses tested included:

- **H1:** Habitat heterogeneity restricts distributions and connectivity, but increases turnover in sediment-dwelling fauna.
- **H2:** Exposed abyssal rock formations affect sediment deposition and erosion, forming environmental gradients and food patches that influence community composition and diversity in both rock and sediment habitats.

The research built on findings from FS Sonne cruise SO237 (Vema-TRANSIT), which revealed unexpectedly high structural complexity in abyssal seabed topography, resulting in predictions of widespread rock formations. RUBBLE examined the variability in soft sediment composition, its dependence on bathymetric heterogeneity, and the resulting effects on biodiversity.

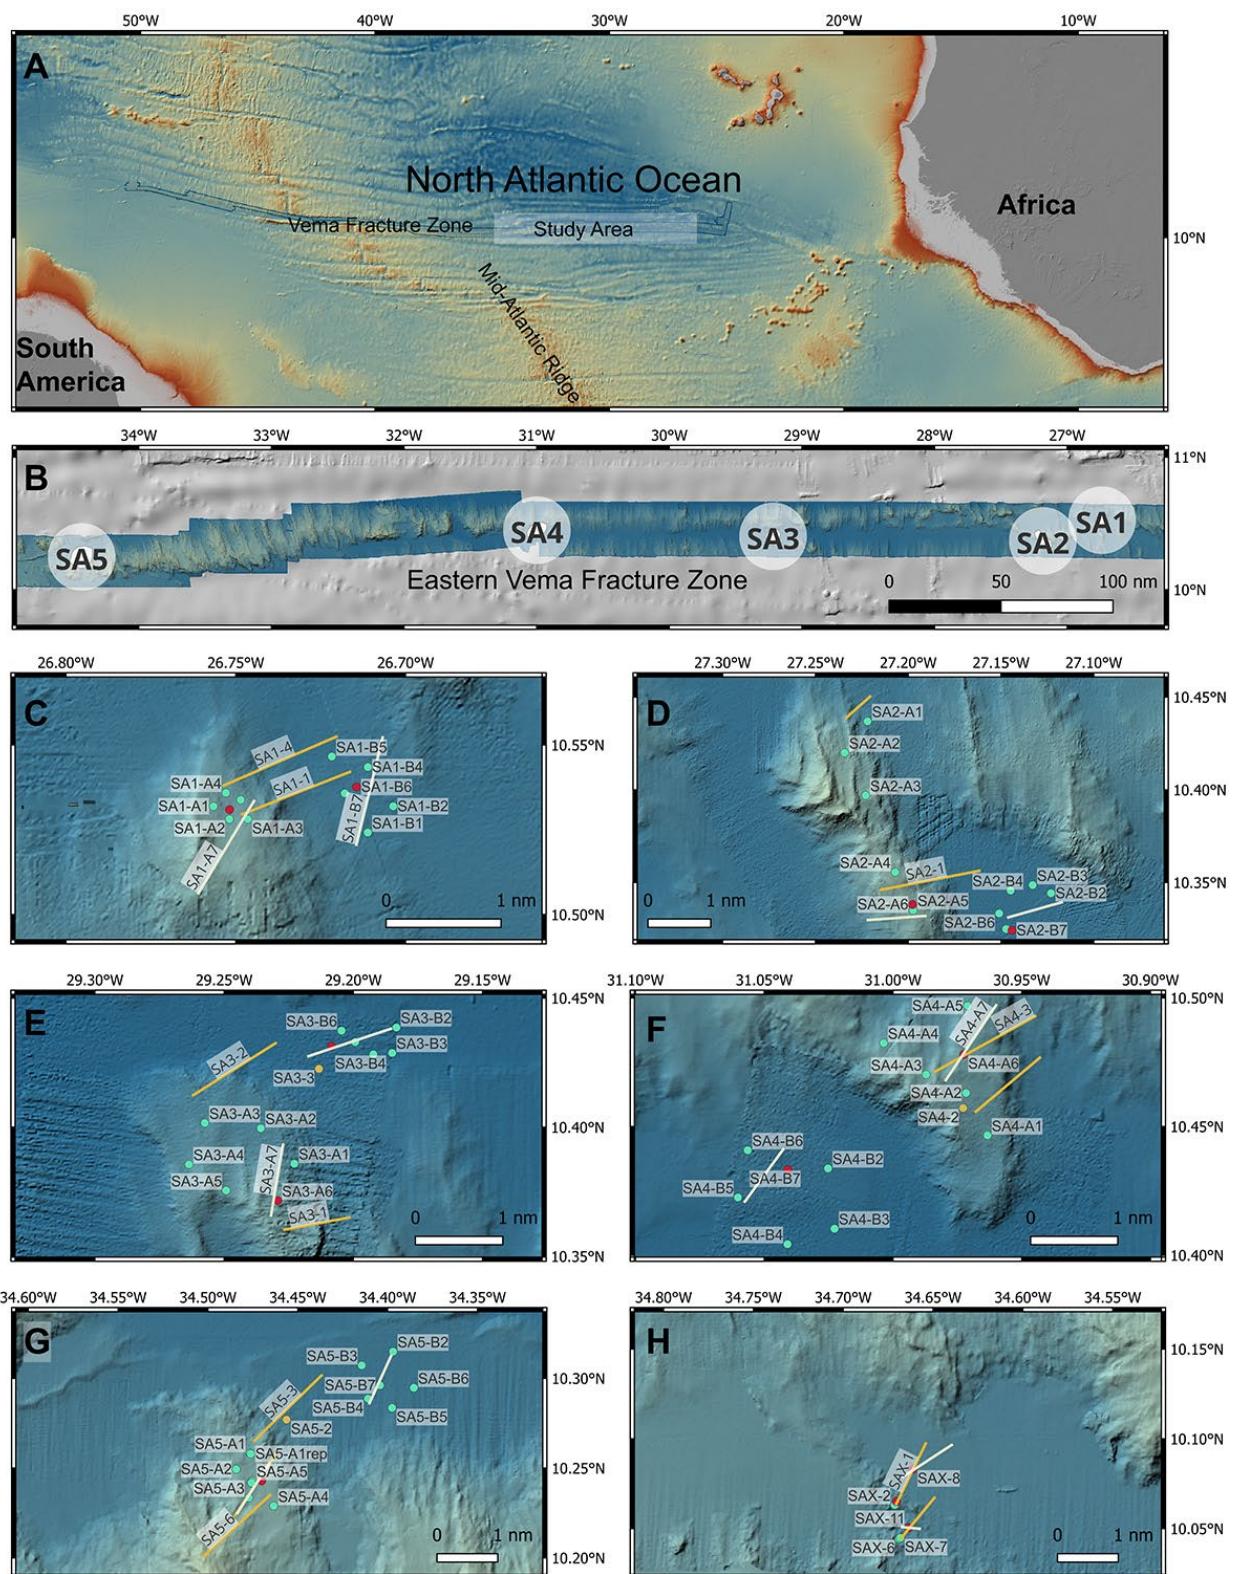

Figure 2: Sampling areas of the 205th voyage of the research vessel METEOR. **A.** Overview map of the tropical North Atlantic with highlighted target area of the expedition with relief based on GEBCO. **B.** Eastern Vema Fracture Zone with the 5 sampling areas SA1–SA5. The bathymetry data obtained during the RV SONNE expedition SO237 are shown in colour, outside areas are based on GEBCO and shown in greyscale. **C–H.** The RUBBLE sampling areas. Due to their surface roughness and hardness, represented by yellow-red tones, mountains and hills (Sites A) on the seabed have a high potential for rocky habitats. They are more or less surrounded and separated by shallow sediment plains (Sites B). **C.** Sampling area SA1. **D.** Sampling Area SA2. **E.** Sampling Area SA3. **F.** Sampling Area SA4. **G.** Sampling Area SA5. **H.** Extra Sampling Area SAX. Map: Dr Torben Riehl, SENCKENBERG, chief scientist M205.

Narrative

The expedition commenced on the evening of 24 October 2024 from Las Palmas, following clearance from the German research vessels' control centre to exceed the 10-knot speed limit. On 25 October, scientific equipment was unpacked, secured on deck, or stowed back in containers, with laboratory setups and mission planning occupying the subsequent days. Research activities began promptly upon entering international waters at 21:40 UTC on 25 October.

Seafloor mapping commenced using the EM122 multibeam echo sounder at full speed, contributing to the Seabed 2030 initiative. Concurrently, Saharan dust collection began with sticky traps installed atop the ship's mast, with plans to extend collection to drone-based platforms during station work. At 02:00 on 27 October, international waters were exited, necessitating a temporary halt in data recording.

Sampling Area SA1 (24 Oct–1 Nov 2024) was located in the eastern Vema Fracture Zone (Figure 2), a tectonic region marked by habitat heterogeneity. SA1 operations included: two OFOS deployments, multiple *Sargassum* and plankton samples, eight (+one repeated) BC deployments, two MUC and two EBS deployments, seven drone flights (one with experimental dust collectors). Approximately 150 GB of visual data were captured. Issues arose during BC deployments, including a broken weld seam and cable difficulties, leading to adjustments in schedule. SA1 concluded successfully at 14:00 on 1st November.

In the third week of the RUBBLE expedition M205, the revision of the station planning was finalised, considering the local bathymetric and weather conditions for the entire expedition. The station works in the sampling areas SA2 and SA3 (Figure 2) were finalised and the transit to SA4 was carried out. Area SA2 included 2 successful OFOS deployments, multiple sampling of pelagic *Sargassum*, several plankton samples collected, 5 successful BC deployments (out of a total of 12 deployments), two successful MUC deployments, 2 successful EBS deployments, 5 successful drone flights. Work on SA2 was completed on 05/11/2024 around 13:45 UTC. Several BC missions were unsuccessful. In some cases, the device returned in a cocked state (not triggered), in others the BC was triggered but empty. After numerous attempts to obtain at least three BC samples, the SA2-B sampling site was ultimately completed unfinished, as a solution to the problems had to be sought first and the schedule should not be jeopardized.

In area SA3 (Figure 2), an identical equipment sequence was planned and deployed almost unchanged. In this area, 2 successful OFOS deployments, another sampling of the pelagic *Sargassum*, several plankton hauls, 6 successful BC deployments (out of a total of 11 deployments), two successful MUC deployments, 2 successful EBS deployments and 6 successful drone flights were carried out. Work on SA3 was completed on 9 November 2024 at around 21:30 UTC. Despite numerous attempts to rectify the numerous failures of the BC by partially replacing components or varying the mission protocol, there was once again a sobering number of failures, meaning that extensive repairs ultimately had to be carried out. Nevertheless, the SA2 and SA3 areas' sampling were overall successes.

For public relations, 3 posts and 2 stories were published on Instagram in the past week. In addition, there was a live broadcast at the annual celebration of the Academy of Sciences and

Literature in Mainz and interactions with visitors to the Senckenberg Museum in Frankfurt. In the fourth week of the RUBBLE expedition M205, station work was successfully completed in the sampling areas SA4 and started in SA5 (Figure 2). Area SA4 included 2 successful OFOS deployments, 6 successful BC deployments (out of a total of 10 deployments), two successful MUC deployments (out of 3 attempts), 2 successful EBS deployments, 3 successful drone flights. Work on SA4 began on 10 November 2024 in the afternoon and was completed after 3 days.

In the SA5 area (Figure 2), 2 successful OFOS deployments, another sampling of pelagic *Sargassum*, several plankton hauls, 8 successful BC deployments (out of a total of 10 deployments), 1 successful MUC deployment (the second will be repeated), 2 successful EBS deployments and 3 successful drone flights were carried out.

In the area of public relations, 2 posts and 1 story were published on Instagram and Facebook last week. There was also a live link to the "Aha!" research workshop at the Senckenberg Museum in Frankfurt, where over 70 guests were able to put questions to two scientists on board the METEOR. Videos were also shot for a short film by YouTube artist Ze Frank.

In Sampling Area SA5 (Figure 2), eight BC deployments, one MUC deployment and two EBS deployments were completed. Remarkably, all five BC deployments were successful for the first time on 18 November. Public outreach content of week 4 included 2 posts, one story on social media, a live workshop at the Senckenberg Museum, and Q&A sessions with over 70 participants.

The SAX stations (Figure 2) focused on potential manganese nodule fields, with three OFOS surveys, four BC, 3 MUC and two EBS deployments. The first BC attempts were hampered by positioning problems. Despite the difficulties, manganese nodules, crusts and volcanic glass were successfully sampled. The last OFOS survey ended on 22 November at 11:55 ship time, completing the station work. This was followed by a 24-hour deep-water calibration of the EM122 echo sounder with additional transit bathymetry before heading to Fortaleza, Brazil, on 23 November, where we arrived in the morning of November 28 2024.

The expedition has progressed steadily, and overall successfully despite technical challenges, maintaining contributions to scientific research and public engagement. During the final days of the expedition, an unexpected situation arose: a general strike by the Brazilian customs department prevented us from shipping our samples and equipment. To ensure their safe transportation, including maintaining uninterrupted cold storage for a significant portion of the samples, we decided to leave everything on board the RV METEOR. Arrangements are being made for a logistics agency to collect the containers and for a courier service to retrieve some of the samples at the next port, Belem, Brazil.

Figure 3: Scientific party and crew (incompletely represented) of RV METEOR cruise M205.

Acknowledgements

In the name of the principal investigators and the entire scientific party of M205 (Figure 3), I extend our heartfelt gratitude to Captain Rainer Hammacher and his crew for their outstanding support, teamwork, and for fostering a positive atmosphere throughout the cruise. The dedication and efforts of the RV METEOR crew were essential to the success of the expedition.

Angelika Brandt and Pedro Martínez Arbizu provided ample support and assistance as co-chief scientists, for which I am deeply thankful.

I also deeply appreciate the commitment and hard work of the scientists, technical staff, and students, whose invaluable contributions made this mission possible. Special thanks to Julia Wenzel and Andreas Raeke from the German National Meteorological Service (DWD) for their daily weather briefings.

I am especially grateful to the Leitstelle Deutsche Forschungsschiffe and Briese Research for their critical support, as well as to the Gutachterpanel Forschungsschiffe (GPF) for their evaluation and the GPF Geschäftsstelle for their assistance.

This expedition was made possible through funding for the "RUBBLE" project from the German Research Foundation (DFG) and the Federal Ministry of Education and Research (BMBF).

Additionally, the OFOS missions were financed thanks to a generous private donation, and the OFOS itself was provided by the GEOMAR Helmholtz Centre for Ocean Research Kiel.

Teilnehmerliste

1	Nico AUGUSTIN	Geology, Bathymetry, CTD	GEOMAR
2	Franziska BERGMEIER	Biology	ZSM
3	Moritz BOLL	Film maker	Boll Filme
4	Angelika BRANDT	Co-Chief Scientist	SENCKENBERG
5	Marco BRUHN	Technician, Box Corer, logistics	SENCKENBERG
6	Linus Vincent BUDKE	Seafloor imaging	SENCKENBERG
7	Anchita CASAUBON	PhD student, biology	SENCKENBERG
8	Christopher CRUZ GOMEZ	PhD student, biology	ECOSUR
9	Angelina EICHSTELLER	Biology	SENCKENBERG
10	Andreas GÄRTNER	Geology, Sedimentology	SENCKENBERG
11	Nicole GATZEMEIER	Technician, EBS, macro imaging	SENCKENBERG
12	Annika HELLMANN	Technician, MUC	SENCKENBERG
13	Mats Ole HENSELER	MSc-Student, biology	SENCKENBERG
14	Franziska IWAN	Technician, data base, dangerous goods	SENCKENBERG
15	Julia JACOBY	MSc student	SENCKENBERG
16	Stefanie KAISER	Biology, EBS, Macrofauna	UL
