Short Cruise Report
R/V SONNE cruise SO258 Leg 2

Colombo (Sri Lanka) - Colombo (Sri Lanka)
12.07.2017 - 17.08.2017

Chief Scientist: Dr. Wolfram Geissler
Captain: Oliver Meyer

Objectives

R/V SONNE cruise SO258 is part of the research project INGON, which is a collaboration between the Alfred Wegener Institute Helmholtz Centre for Polar and Marine Research (AWI) in Bremerhaven and the GEOMAR Helmholtz Centre for Ocean Research in Kiel. Using the example of the Indian-Antarctic Breakup c. 130 m.y. ago, SO258 INGON aims to investigate magmatic and tectonic processes that trigger the breakup of continents and the formation of ocean basins. This is not only an important topic in basic research contributing to a better understanding of the Earth system but also provides important data on the relations between magmatic and volcanic activity and their influence on environment, climate, and ecological systems. Many questions remain concerning the Indian/Sri Lanka separation from Antarctica during the break-up of Gondwana. When was the initiation of the breakup? Was it triggered by a hotspot, which generated the Rajmahal Trap basalts (plume head) and 85°E ridge (plume tail), one of in total three prominent basement ridges in the Indian Ocean? Did the extremely rapid drift of India/Sri Lanka begin at breakup or instead at ~67 Ma triggered by a different process? Determination of the timing of the rapid motion (~18 cm/yr) has major implications for its cause. To answer these questions, obtaining an accurate magnetic model for Indian seafloor off Sri Lanka from initiation to \leq 70 Myr is essential. Published kinematic models vary by more than 30 m.y. and therefore the related magmatic processes are unknown. To date, only a single locality along the 85°E Ridge (Afanasy Nikitin) has been sampled, but only two age dates (67 Ma, Krishna et al. 2014, J. Earth Syst. Sci. 123-1) are available and its origin is unclear. The samples from Afanasy Nikitin, however, show the most enriched (continental-like) isotopic ratios of any rocks analyzed from the ocean basins thus far. The origin of this geochemical anomaly, however, is still unclear. The major objective of SO258 Leg 2 INGON is testing current plate kinematic/ geodynamic models for the separation of India/Sri Lanka from Antarctica and the rate of drift of the Indian plate by a combination of various geophysical methods (magnetics, seismics, gravity, bathymetry). In this context, the structure and geometry of the continent-ocean transition (COT) south of Sri Lanka, the adjacent oceanic crust, as well as the structure of the 85°E Ridge will be investigated during cruise SO258 leg 2. These investigations were preceded on SO258 Leg 1 by complementary geochronological-geochemical studies conducted by the GEOMAR Kiel.

Narrative

R/V SONNE Cruise SO258 leg 2 started in Colombo, Sri Lanka. Already on July 9, some members of the scientific party visited the ship that had arrived in the morning and began with the installation of the gravity meter. On Monday, July 10, a pre-cruise meeting was held at the Foreign Affairs Ministry of Colombo, organized by the National Ocean Affairs Committee, to discuss the objectives of the cruise and related more technical issues. In the meantime, the first parts of the equipment were unloaded from the containers. In the course of July 11, the SO258 leg 2 scientific party embarked R/V SONNE. The scientific party continued with setting-up the laboratories and preparations of the equipment. R/V SONNE set sail in the morning of July 12.

Already in the late afternoon of July 12 we reached our first scientific station. The first cast was a CTD to measure temperature and conductivity within the water column. This data was used to calculate the speed of sound in the water to calibrate the echo sounder systems. Afterwards the release units of the ocean-bottom seismometers (OBS) were tested successfully. These tests continued until the early morning of July 13, 2017. After we had passed the sea route at Dondra Head, the towed magnetic system was deployed and systematic measurements started along the first profile at 07:30 LT. The fixed three-

component fluxgate magnetometer system of our Japanese cooperation partners acquired data already since we left the harbor of Colombo. The systematic survey of the Earth's magnetic field to the south of Sri Lanka had the highest priority during cruise SO258 leg 2. July 14 we passed the equator for the first time. A first mobile sound velocity probe was deployed to update the sound velocity profile necessary for the echo sounders. Since the profile was similar to the first measured profile, no corrections had to be made. In the morning of July 15 magnetic measurements had to be interrupted unexpectedly, since the towed sensor had to be changed due to technical problems. In the afternoon of July 15 another mobile CTD was deployed. Afterwards R/V SONNE did double loops ("8" turn) to calibrate the fixed magnetometer system. Using data recorded on the calibration loops allow correcting for the influence of the magnetic field of the vessel. Since we left the harbor, three marine mammal observers investigated which animals were present within our study area. First sightings included whales, dolphins, whale sharks, turtles and birds. These first observations were used to adjust the mitigation procedures for the seismic measurements.

In the afternoon of July 17 the southernmost point of the profile slightly south of 11° S was reached. On the way to the south the weather had become worse. A strong high-pressure field south of our working area was responsible for wind up to strength of Beaufort 9 and high waves. It forced us to turn to the East and go to our second magnetic profile along 81° E. In the night towards July 21 the magnetic measurements with the towed system were stopped at 3° N. The tow fish was recovered. The seismic team started to deploy 30 ocean-bottom seismometers (OBS) along the northern profile section up to the southern shelf break of Sri Lanka. More or less every 60 minutes, the next deployment site was reached. Early in the morning of July 22, the last OBSs were deployed in the area of the Traffic Separation scheme and north of it. At that time, there were not only the large container carrier, war ships and tanker vessels, but also many small fisher boats. The nautical officers had to carefully navigate R/V SONNE through all that traffic. After the deployment of the last OBS the vessel went slightly to the east to reach the deployment position for air guns and the magnetometer. Going with slow speed against the current, the deployments went without problems. Unfortunately, the 3000 m long hydrophone cable (streamer) could not be prepared in time to be used along the first profile. Already before and during the deployment, whales, in most cases pygmy blue whales, visited us.

Just after the air guns were at full power and the profile started, one whale surfaced close to the vessel. According to the mitigation plan the air guns had to be stopped immediately. R/V SONNE proceeded on profile towards the south throughout the traffic separation zone without a seismic source signal. After a defined period of quiescence the air guns were activated a second time with reduced signal strength. Since no whale surfaced in the vicinity of the vessel again, the seismic measurements could be continued after reaching full power. After two days of continuous profiling along the 81st meridian we arrived at the southern end of the profile in the morning of July 24 at 2° 26' N. After the towed magnetometer and the air gun clusters were recovered, the recovery of OBSs started. With only a few exceptions, recovery of the instruments went very well and fast due to good weather conditions and sea state. Within two days R/V SONNE reached the waters south of Sri Lanka again. Towards the coast, strong currents shifted the recovery position of the instruments eastwards. In the evening of July 26, during the recovery of the last OBS close to the coast of Sri Lanka, we were again accompanied by pygmy blue whales. During the remaining days of the third week the magnetic survey was continued. There was only a short break because of a technical test of one of the sensors.

At the beginning of the fourth week R/V SONNE again followed a northern course to measure the Earth magnetic field along the third magnetic profile. Without any disturbances R/V SONNE reached the shelf waters south of Sri Lanka in the afternoon of

July 31. This time the weather and sea were rougher. In the morning of August 1 the towed magnetometer system was recovered to start with the deployment of 21 OBS along the second seismic refraction profile. In the meantime, the preparations for the deployment of the 3000 m long hydrophone cable (streamer) could be finalized. In the morning of August 2, the last of the 21 ocean-bottom seismometers was on its way to the seafloor. R/V SONNE went slightly eastward to start the deployment of the streamer, the airguns and at last the magnetometer. In the following one and a half days the second seismic profile was measured towards NW, crossing all the OBS positions without any interruptions. In the early morning of August 4 recovery of the towed gears and also the OBS started. As already during the deployments everything went well. The weather had become worse during the last couple of days. Beside stronger wind and increased sea state, we also got heavy rainfalls at the vessel from time to time. During the rainfalls the wind strength increased from Beaufort 6 or 7 up to 9 for short intervals. But shortly after, the sun was shining again. Since the R/V SONNE runs stable within the sea, all planned actions and measurements could be carried out. Till August 6 R/V SONNE again sailed on SE course to recover OBS. Although the weather was quite rough and made the recoveries more difficult, the experienced crew was able to bring all instruments safely home. Unfortunately, we failed at one station to set communication with the release unit at the seafloor.

The fifth week was fully dedicated to the measurements of the Earth's magnetic field along the planned N-S profiles using both the towed and fixed magnetometer systems. To be able to run all along the remaining many profile kilometers R/V SONNE went on full speed from now on. In the early morning of August 9, close to 3° S, again a mobile sound velocity probe was deployed to validate the calibration data of the hydro-acoustic systems. August 10 decision was made to continue with magnetic measurements until the very end of the cruise. Unfortunately, there was not enough time left to measure another seismic profile. In the very early morning of August 12, a severe problem with the towed magnetometer system occurred that could not be fixed on board. From this time on, only the fixed magnetometer system was in operation, together with the gravity meter and the echo sounders. The weather during the last week changed very often. Pretty sunshine interchanged with heavy rainfalls. Wind strength ranged from 5 to 7. Also the heights of the waves increased temporarily, mostly in the southern part of our survey area.

At the beginning of the sixth week, R/V SONNE reached again the shelf break southeast of Sri Lanka on August 14 at noon. It was again a great opportunity for our marine mammal observers to spot pygmy blue whales. Scientific party members that were not scheduled for watches were busy with packing all the scientific equipment. All devices had been dismantled and packed into boxes. Finally the containers could be stowed. On August 15 and 16 we completed the magnetic survey grid with the missing northern parts of two N-S profiles. All devices still in operation worked very well. Scientific data acquisition was finished August 16 at 23:00 local time. After a short transit from the last scientific profile R/V SONNE reached the pilot station at the entrance to the port of Colombo in the morning of August 17 around eight o'clock. The sun just had risen above the city. With a slight delay the pilot together with the help of a tug guided R/V SONNE towards the North Pier. At eleven o'clock the vessel finally arrived at the pier. After all scientific equipment, 5 containers and the big streamer winch, was taken from board, the gravity tie measurements were carried out beside the vessel and at known localities in Colombo, using a mobile gravity meter in the evening of August 17. A first group of scientist had already disembarked in the afternoon. The remaining members of the scientific party disembarked during August 18 and 19.

In the morning of August 18, a post-cruise meeting took place at the Foreign Affairs Ministry of Colombo, organized by the National Ocean Affairs Committee, to inform about the cruise and first preliminary results and discuss plans for the future. In the afternoon

employees of the German Embassy visited RV SONNE. Students of the universities Peradeniya and Ruhuna got a guided tour on the vessel in the morning of August 19. In the evening, the Ambassador of the Federal Republic of Germany in Sri Lanka, H. E. Jörn Rohde, invited for a cocktail reception onboard RV SONNE.

Acknowledgements

We thank the Captain Oliver Meyer and the crew of R/V SONNE for their professional and friendly support of the scientific work at sea. Their hard work, high level of experience, great flexibility and willingness to help, as well as the pleasant working atmosphere on board, contributed directly to the success of the SO258 leg 2 expedition. We are also grateful to the German Federal Ministry of Education and Research for continuing support of marine research. Additional funding was provided by AWI Bremerhaven and NIPR Tokyo. Much appreciated support has been given by the Projekträger Jülich, Leitstelle Deutsche Forschungsschiffe in Hamburg, and Briese Schiffahrts GmbH & Co. KG. Furthermore we thank the German instrument pool for amphibian seismology (DEPAS) for providing instruments and technical support. We thank all unnamed people in our institutes and somewhere else that made this cruise to a successful expedition. Lastly, we would also like to thank the German Ministry of Foreign Affairs and the Embassy of Germany in Colombo for acquiring the necessary research permits.
